Smithers thinks that a special juice will increase the productivity of workers. He creates two groups of 50 workers each and assigns each group the same task (in this case, they're supposed to staple a set of papers). Group A is given the special juice to drink while they work. Group B is not given the special juice. After an hour, Smithers counts how many stacks of papers each group has made. Group A made 1,587 stacks, Group B made 2,113 stacks.

Identify the:

1. Control Group
2. Independent (Manipulated) Variable
3. Dependent (Responding) Variable
4. What should Smithers' conclusion be?
5. How could this experiment be improved?

Homer notices that his shower is covered in a strange green slime. His friend Barney tells him that coconut juice will get rid of the green slime. Homer decides to check this this out by spraying half of the shower with coconut juice. He sprays the other half of the shower with water. After 3

days of "treatment" there is no change in the appearance of the green slime on either side of the shower.

6. What was the initial observation?

7. Control Group
8. Independent (Manipulated) Variable
9. Dependent (Responding) Variable
10. What should Homer's conclusion be?

Bart believes that mice exposed to radiowaves will become extra strong (maybe he's been reading too much Radioactive Man). He decides to perform this experiment by placing 10 mice near a radio for 5 hours. He compared these 10 mice to another 10 mice that had not been exposed. His test consisted of a heavy block of wood that blocked the mouse food. He found that 8 out of 10 of the radiowaved mice were able to push the block away, 7 out of 10 of the other mice were able to do the same.

Identify the:

11. Control Group
12. Independent (Manipulated) Variable
13. Dependent (Responding) Variable

system in 1987 it was heralded as a technology that would revolutionize law enforcement As an investigative tool it has lived up to much of this hype it is regularly used to track down unknown criminals put murderers and rapists behind bars and exonerate the innocent Yet this promise took ten turbulent years to be fulfilled In *Genetic Witness* Jay D Aronson uncovers the dramatic early history of DNA profiling that has been obscured by the technique's recent success He demonstrates that

robust quality control and quality assurance measures were initially nonexistent interpretation of test results was based more on assumption than empirical evidence and the technique was susceptible to error at every stage Most of these issues came to light only through defense challenges to what prosecutors claimed to be an infallible technology Although this process was fraught with controversy inefficiency and personal antagonism the quality of DNA evidence improved dramatically as a result Aronson argues however that the dream of a perfect identification technology remains unrealized

Regulation of Gene Expression in Plants Carole L. Bassett, 2007-02-15 Except for one area of gene expression control plant research has significantly fallen behind studies in insects and vertebrates The advances made in animal gene expression control have benefited plant research as we continue to find that much of the machinery and mechanisms controlling gene expression have been preserved in all eukaryotes Through comparison we have learned that certain aspects of gene regulation are shared by plants and animals i.e both contain introns separating the coding regions of most genes and both utilize similar machinery to process the introns to form mature mRNAs

Yet there are some interesting differences in gene structure and regulation between plants and animals. For example, unlike animal genes, plant genes are generally much smaller with fewer and smaller introns. Regulation of Gene Expression in Plants presents some of the most recent novel and fascinating examples of transcriptional and posttranscriptional control of gene expression in plants and where appropriate provides comparison to notable examples of animal gene regulation. The Genomes of Rosaceous Berries and Their Wild Relatives Timo Hytönen, Julie Graham, Richard Harrison, 2018-06-08. This book collates the most up to date information on *Fragaria* and *Rubus* genomes. It focuses on the latest advances in the model system *Fragaria vesca* along with the allied advances in economically important crops. Covering both basic and applied aspects of crop genomics, it illustrates strategies and resources for the study and utilization of genome sequences and aligned functional genomics resources. Rosaceous berries are collectively an increasingly important set of high value global crops with a trade value of over 2 billion dollars per annum. The rosaceous berries strawberry, raspberry and blackberry share some common features at the genome scale, namely a range of ploidy levels in each genus and high levels of heterozygosity and associated inbreeding depression due to self incompatibility systems, dioecy or multispecies hybridization events. Taken together, although the genomes are relatively compact, these biological features lead to significant challenges in the assembly and analysis of berry genomes, which until very recently have hampered the progress of genome level studies. The genome of the woodland strawberry *Fragaria vesca*, a self compatible species with a homozygous genome, was first sequenced in 2011 and has served as a foundation for most genomics work in *Fragaria* and to some extent *Rubus*. Since that time, building upon this resource, there have been significant advances in the development of genome sequences for related crop species. This, coupled with the revolution in affordable sequencing technology, has led to a suite of genomics studies on *Fragaria* and more recently *Rubus*, which undoubtedly aid crop breeding and production in future years. **Your Best Brain Ever** Michael S.
