management and applied probability and statistics *AI Foundations and Applications with MATLAB* Ying Bai, 2025-09-03

This textbook provides fundamentals and practical skills on AI foundations and applications with two MATLAB programming modes. It includes twelve chapters with detailed introductions for the foundation knowledge of AI structures, key components, and hands-on AI projects implemented in various applications in our world. Unlike other AI-related textbooks in which the Python is used, the MATLAB is adopted in this textbook. The Python programming mode builds AI projects with functions involving huge blocks of codes, which is a difficult task. However, in MATLAB mode, provides two programming styles: Apps and function library. The Apps graphical user interface (GUIs) assist users, especially the beginners, to learn and build AI projects with no coding lines quickly and easily. To compensate the possible code hiding in Apps, MATLAB provides a Converting Codes function to allow users to convert those Apps to the related codes. It enables users to have a clear picture between Apps and detailed coding process. The function library enables users to build AI projects with detailed codes. This textbook also includes homework questions, exercises, lab projects, and case studies. This book is designed as a textbook for advanced level students in Computer Science or Computer Engineering. Also, AI engineers who have an interest in learning and developing professional AI applications to solve real problems in the world will want to purchase this book.

Electric Drives Ion Boldea, 2025-09-10

Electric Drives now in its fourth edition provides a practical guide in understanding the fundamental principles and recent new knowledge of electric motion in motoring and electric energy flow in generating digital control via power electronics for energy savings and increased productivity in practically all industries from intelligent watches and phones to robots, electric transport, industrial processes, and modern distributed electric power systems with ever more renewable energy penetration. Every proposition, number, figure, and reference has been revisited to bring necessary changes with new references to key recent knowledge trends to reflect the present state of the art. The book has been restructured with a few chapters combined and one chapter on rectifier d c brush motor drives removed. New introductory paragraphs in most chapters, many as inspiring case studies, and brand new chapters on flux modulation machine drives, Chapter 8 and predictive control of a c drives, Chapter 15, reflecting this updating effort. The large number of new case studies complements the large number of worked numerical examples, and the 10 user-friendly MATLAB and SimulinkR programs that remain available online. Although inevitably the math is intensive and intended to be directly usable, the book is mainly intended for senior undergraduate and graduate students and engineers in research and development in industry. It is a practical, easy-to-assimilate and up-to-date synthesis of basic and advanced power electronics, variable speed electric motor/generator drives needed in all industries in which electric energy flow wise, mainly digital intelligent control is paramount.
