6. Have some of your group go on the ride (if more than 1 person in your group rides, try to sit in different areas of the ride – front, middle, rear) and then have them describe their feelings at different points of the ride. Label the points on your sketch where they felt the heaviest and where the lightest (weightless). Use your observations of the ride, and your “gut feeling” while riding the ride to assign an acceleration value (a number from the table on the first page) for each turn and turn. Please label these numbers (positive or negative) on your diagram.

7. Some coaster enthusiasts say that passengers in the first car, middle car and last car experience the ride differently. If you were able to do this, what did you think? If not, just write “N/A.”

8. Where was the acceleration the greatest? What caused this large acceleration? (Remember that acceleration is a vector quantity and depends on magnitude and direction)

9. Compare the second highest point with the highest point of the ride. Discuss the height of the hill, velocity of the train, Potential Energy and Kinetic Energy...how are they different or similar from one another?

### Ride #2

Ride Chosen: \_\_\_\_\_

1. Do the trains use motors for the entire trip or only part of it? From where do the trains get the energy to complete the course? Explain your reasoning.

2. Observe the wheel assembly on the trains. Draw a sketch and describe why you think the wheels are made that way.
