Resources in education ,1987-07 *Salinity and drought stress in plants: understanding physiological, biochemical and molecular responses, volume II* Muhammad Waseem, PingWu Liu, Sunil Kumar Sahu, Umashankar Chandrasekaran, 2025-07-31 This Research Topic is part of the series Salinity and Drought Stress in Plants Understanding Physiological Biochemical and Molecular Responses Drought and salinity are two of the foremost environmental factors which restrict plant growth and yield in several regions of the world especially in arid and semi arid regions Due to global climate change drought and salinity are predicted to become more widespread and eventually result in reduced plant growth and productivity in numerous plant species Exposure of plants to extreme drought or salt stress ceases plant growth while plants exposed to moderate stress generally show a slight change in their growth performance Scientists are facing the challenging task of producing 70% more food to feed an additional 2.3 billion people by 2050 Therefore it is imperative to develop stress resilient crops with better yields under drought and salt stress to meet the food requirements of upcoming generations Drought and salinity have significant inhibitory impacts on cellular redox regulation with remodelled plant architecture Salinity hampers plant growth in two phases the first phase leads to plant growth suppression due to the osmotic effect of ions present in soil solution and the second phase leads to growth inhibition caused by ion toxicity due to the uptake and accumulation of specific ions The first phase of salt stress is very similar to that of drought stress However growth under salinity is restricted primarily by osmotic stress Thus creating drought resistant tolerant species would produce plants well suited to a saline environment As salinity in its first phase of salt stress is much like that of drought stress common responses to salinity and drought stresses are expected This Research Topic explores both the common and distinct responses of plants under salinity and drought which modify plant growth and adaptation Furthermore it will seek to understand the biochemical physiological and genetic mechanisms which are critical for improving plant tolerance to these environmental stresses In recent years due to the advancement in omics and breeding technologies significant progress has been made in this direction but knowledge gaps still exist The efforts in translating the knowledge gained through basic research should be expedited to achieve the desired outcomes of enhancing crop

productivity and ensuring global food and nutritional security To ensure the focus remains on impactful applied research we will not be accepting submissions that are purely descriptive in nature We will include contributions on themes such as Mechanistic insights into plant responses to drought and salinity Understanding of the ROS regulation under salinity and drought stress Tools or resources for engineering drought and salt resistant crops Plant breeding towards stress tolerant crop varieties by developing molecular markers and high throughput approaches The role of signal transduction and signaling cascades in response to drought and salinity The use of multi omics approaches to provide insights into traits defining stress tolerance for crop improvement Physiological molecular and genetic mechanisms underlying adaptation of agronomically important crops to abiotic stresses Functional validation and physiological insights of key genes and proteins involved in stress tolerance Advancement in transcriptomic metabolomic proteomic and genomic integrated breeding approaches for enhancing stress tolerance The introduction of new breeding methods to accelerate the rate of genetic gain for sustainable agriculture while maintaining other core traits

Biological Soil Crusts: Spatio-temporal Development and Ecological Functions of Soil Surface Microbial Communities across Different Scales Shubin Lan, David R. Elliott, Sonia Chamizo, Vincent John Martin Noah Linus Felde, Andrew David Thomas, 2024-08-09 Biological soil crusts biocrusts are widely distributed throughout the world and cover approximately 12% of the terrestrial surface Biocrusts are composed of cyanobacteria algae lichens mosses and a great diversity of other microorganisms which bind soil particles together to form a layer of biological soil matrix on the soil surface typically of several millimetres thickness They are important sites of regional and global microbial diversity and perform multiple ecological functions multifunctionality During the evolution of terrestrial life on earth biocrusts are regarded as the main colonising photosynthetic organisms before the advent of vascular vegetation They not only represent the early stages of terrestrial ecosystems but also facilitate the ecosystem s development and succession Therefore biocrusts are recognised as ecological

engineers in the natural development of ecosystems and for the restoration of degraded terrestrial ecosystems The development of biocrusts is highly heterogeneous which is reflected on both temporal and spatial scales and this heterogeneity is still clearly visible even in a small scale However up to now only limited knowledge is acquired on biocrust temporal and spatial organisation In particular there still is a large knowledge gap regarding the various biocrust communities under different developmental states and their related physiological metabolisms and ecological functions Therefore in depth studies of these issues will undoubtedly further promote our understanding of the heterogeneous development of biocrusts as well as their ecological multifunctionality in terrestrial ecosystems The relevant contributions are expected to provide a scientific basis for the management of biocrusts and technology development e g cyanobacteria induced biocrust technology for ecological restoration and the promotion of soil health Proteomics and its Applications in Cancer Suman S. Thakur, Harsha Gowda, D. R. Mani, Bhaswati Chatterjee, 2022-01-11 *Biology: Threads of Life* Sobrasua Ibim, 2010-07-30 Threads of Life is the story of living organisms and their components evolution diversity and interactions with the environment Threads of Life discusses the organisms their common threads or molecules and how these threads promote the evolution of biologically diverse organisms The evolution of organisms occurs through the processes of natural selection or the environmental influences which define how these organisms exist The main idea expressed throughout this manuscript is the presence of common threads that connect all organisms even in diversity These common threads of life that are fundamental in all organisms include cell DNA RNA chemicals food web and many others
