

Endocrine System

by

Have you ever wondered how and why you grow every year, but adults have stopped growing taller? How do babies know when to grow? How do you get energy to run? Why does your heart beat faster than when you are asleep?

The endocrine system, by itself, helps send messages that tell your body what to do. The endocrine system can control blood, growth and development, the way

your metabolism, and
 is. The system can send sugar out to make your heart beat

Why is that? The endocrine system is a system of small organs

that are located in

all body and

The hypothalamus also regulates body fluids, emotional responses, blood pressure, and heart rate.

The hypothalamus works together with the pituitary to release hormones that control other glands.

The pituitary gland produces the hormone melatonin which affects sleep.

The thyroid and parathyroid glands are in your neck.

The thyroid helps control how fast you burn calories and how fast you heart beats.

The parathyroid glands control how much calcium is in the bones and blood, how strong and dense the bones are.

The adrenal glands are located on top of the kidneys. The adrenal glands are known for secreting the hormone adrenaline, which rapidly prepares your body to spring into action in a stressful situation. The adrenal glands produce hormones that help regulate your metabolism, immune

system, blood pressure, response to stress and other essential functions.

The pancreas makes hormones that balance sugar. The pancreas produces the hormone insulin and glucagon to control blood sugar levels throughout the day.

The reproductive system of both men and women includes glands that secrete hormones.

In women the ovaries secrete estrogen, progesterone, and androgens. In men the testes secrete testosterone and produce sperm.

The reproductive system of both men and women includes glands that secrete hormones.

You might have heard the word gland before. For example, you might have heard thyroid glands in your neck. These type of glands are called exocrine glands that secrete substances like sweat or spit through small pores called ducts.

Endocrine glands don't have ducts. They release substances called hormones directly into the blood.

The hypothalamus regulates functions like heart, breathing, and sleep patterns.

There are several different glands located in your brain.

The hypothalamus regulates functions like heart, breathing, and sleep patterns.

The hypothalamus regulates functions like heart, breathing, and sleep patterns.

The endocrine system works to make sure the right amount of each hormone. The ducts in the body of a hormone can make you sick.

Endocrine is a hormone-based problem caused by too little of the hormone made. Hormones help the body use sugar. When making too little sugar, sometimes the sugar stays in the blood and makes them sick.

Human Brain Stephen Gislason MD, 2018-04-21 Understanding the human brain is essential to become a well informed modern citizen As always nonsense proliferates around popular topics The author of the human Brain is a physician writer an expert navigator who can steer you away from nonsense and help you understand practical details about brain function and disease This is a big book with big ideas so be prepared to read re read and then keep the book as reference Read topics from the book by clicking links to the left Dr Gislason s Preface My goal in writing this book is to provide a guide to intervention in disorders of brain function The brain is the organ of the mind Therefore molecular influences that alter the function of brain are manifest as mental influences Brains are delicate devices that need special care to work well When brains do not function well disorders of sensing deciding acting and remembering occur Food is the major source of

molecular influences on the brain and therefore on mind states Finding and consuming food is the main business of all animal brains and remains the priority in the organization of human behavior An integrated view of body mind does not draw artificial boundaries among different events Psyche does not affect Soma or vice versa Psyche and Soma are one interacting whole system Behavioral adaptation to environment is intermeshed with molecular adaptation This means that mind and body interact with environment as a single integrated unit Molecular events determine mind body events just as mental or behavioral events determine molecular events There is little argument that diseased arteries that carry blood to the brain lead toward the most prevalent and often the most devastating loss of brain function High blood pressure and plugged arteries work together to produce strokes Other brain diseases are not so obvious The role of the environment and dietary problems in creating emotionally and mentally disturbed people has been underestimated or ignored Bad environments and problems in the food supply can disturb brain function in entire populations Bad chemicals are more powerful than good intentions and good ideas unless the good idea is to remove the bad chemicals from the environment When a fish in an aquarium displays psychotic behavior you do not call a fish psychiatrist you check the oxygen concentration temperature and pH of the water You have to clean the tank and change the fish diet I regret the increasing use of psychotropic drugs The aggressive marketing of drugs that affect the brain has become a major determinant of what people believe and how people behave I was once an advocate of drug therapy but now I believe that we are on the wrong track and advise against taking drugs that affect the mind My work in philosophy takes the broadest view of the human experience and also focuses on the details of how our mind works As a physician I advocate practical solutions to brain dysfunction that are often ignored in medical practice These are solutions that emphasize removing the causes of disease by improving the environment and the food supply Download eBook in PDF format *First Aid for Nurses* Karesh Prasad,2014-05-14 **MCAT General**
