predicted rise in the number of extreme meteorological events accompanied by the concentration of population and infrastructure in mountainous regions will result in an increased number of casualties associated with landslides in the future. The main goal of this doctoral project was to study the effects of pore water pressure perturbations on the stability of unsaturated silty sand slopes and to investigate the mechanisms leading to the initiation and propagation of the shear deformations and eventually possible rapid mass movements. The behaviour of the test slope prior to the failure induced by the artificial rainfall event was investigated using analytical and numerical methods. The mechanical features of unsaturated soils and reinforcing effects of the vegetation were implemented in 2D and 3D limit equilibrium analysis. The possible depth of the failure surface was calculated based on these simplified models and was compared with the depth of the real failure surface in the landslide triggering experiment. The soil bedrock interactions in terms of the pattern of pore pressure distributions and their influence on stabilising or destabilising the slope were studied and the results were compared to the field measurements.

Hazardous Materials Reference Book Daniel J. Davis, Julie A. Davis, 2006-01-23. This one stop reference gives firefighters and emergency response personnel immediate access to the page number where chemical data on nearly 1 000 substances can be located in 13 of the most frequently used references. It speeds up research time by alphabetizing chemicals by name and with UN NA numbers.
