Pharmacokinetics

- The process of drug movement throughout the body necessary to achieve drug action.
- **What the body does to the drug**
- Composed of four processes:
 1. Absorption
 2. Distribution
 3. Metabolism
 4. Excretion
- **Drug absorption**
 - The movement of the drug into the bloodstream after administration.
 - Approximately 80% of drugs are taken by mouth (oral).
 - These are the only drugs to pass through the GI tract
 - If or the body to use drugs taken by mouth, a drug in a solid form (e.g., tablet or capsule) must disintegrate into small particles and combine with a liquid to form a solution, a process known as dissolution (drugs in a liquid form are already in solution), to be absorbed from the GI tract into the bloodstream
 - Tablets are not 100% drug. Fillers and inert substances – such as simple syrup, vegetable gums, aromatic powder, honey, and various oils – called excipients are used in drug preparation to allow the drug to take on a particular size and shape and to enhance drug dissolution.
 - **Disintegration** - Breakdown of oral drug form into small particles.
 - **Dissolution** - Combining small drug particles with liquid to form a solution.
 - The rate of dissolution is the time it takes the drug to disintegrate and dissolve to become available for the body to absorb it.
