

**Objectives:** To find the multiplicative inverse of a matrix  
To use the multiplicative inverse of a matrix to solve a system of equations

**FOCUS**

Cryptographers use a variety of schemes for encoding messages. A simple substitution cipher was presented in Lesson 1.4. To ensure security of sensitive information, a cryptographer may also use matrix operations to encode messages.

A matrix-based cryptography system will usually replace a group of two or three letters in a row by an equal number of letters in the encoded message. By using matrix multiplication in the encoding process, an individual letter can be encoded as a different letter in different parts of the coded message. Such ciphers are designed to be difficult to decode since they require the use of the *inverse* of the encoding matrix. During World War II, Allied analysts such as Alan Turing (1912–1954) were able to break German codes produced by the Enigma machine using sophisticated decoding techniques.

Recall that the product of an identity matrix with any matrix  $A$  of equal order is the matrix  $A$ , that is,  $AI = A = IA$ . When the product of two square matrices  $A$  and  $B$  is the identity matrix,  $AB = BA = I$ , then  $A$  and  $B$  are *multiplicative inverses* of one another. The notation  $A^{-1}$  is used to denote the multiplicative inverse of matrix  $A$ . Thus,  $B = A^{-1}$  and  $A = B^{-1}$ . Note that only square matrices can have multiplicative inverses. *Why?*

**Example 1** Show that matrix  $B$  is the multiplicative inverse of matrix  $A$ .

$$A = \begin{bmatrix} 4 & 3 \\ 3 & 2 \end{bmatrix} \text{ and } B = \begin{bmatrix} -2 & 3 \\ 3 & -4 \end{bmatrix}$$

$$AB = \begin{bmatrix} 4 & 3 \\ 3 & 2 \end{bmatrix} \begin{bmatrix} -2 & 3 \\ 3 & -4 \end{bmatrix} = \begin{bmatrix} -8 + 9 & 12 - 12 \\ -6 + 6 & 9 - 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$BA = \begin{bmatrix} -2 & 3 \\ 3 & -4 \end{bmatrix} \begin{bmatrix} 4 & 3 \\ 3 & 2 \end{bmatrix} = \begin{bmatrix} -8 + 9 & -6 + 6 \\ 12 - 12 & 9 - 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Since  $AB = BA = I$ , then  $A$  and  $B$  are inverses of one another. Thus,

$$A^{-1} = \begin{bmatrix} -2 & 3 \\ 3 & -4 \end{bmatrix} \text{ and } B^{-1} = \begin{bmatrix} 4 & 3 \\ 3 & 2 \end{bmatrix}.$$

Advanced Calculus for Mathematical Modeling in Engineering and Physics David Stapleton, 2024-06-20. Advanced Calculus for Mathematical Modeling in Engineering and Physics introduces the principles and methods of advanced calculus for mathematical modeling through a balance of theory and application using a state space approach with elementary functional analysis. This framework facilitates a deeper understanding of the nature of mathematical models and of the behavior of their solutions. The work provides a variety of advanced calculus models for mathematical, physical science, and engineering audiences with discussion of how calculus based models and their discrete analogies are generated. This valuable textbook offers scientific computations driven by Octave/MATLAB script in recognition of the rising importance of associated numerical models. Adopts a state space functional analysis approach to advanced calculus based models to provide a better understanding of the development of models and the behaviors of their solutions. Uniquely includes discrete analogies to calculus based models as well as the derivation of many advanced calculus models of physics and engineering instead of only seeking solutions to the models. Offers online teaching support for qualified instructors for selected solutions and study materials for students.

**Geometry of Lengths, Areas, and Volumes** James W. Cannon, 2017-11-16. This is the first of a three volume collection devoted to the geometry, topology, and curvature of 2 dimensional spaces. The collection provides a guided tour through a wide range of topics by one of the twentieth century's masters of geometric topology. The books are accessible to college and graduate students and provide perspective and insight to mathematicians at all levels who are interested in geometry and topology. The first volume begins with length measurement as dominated by the Pythagorean Theorem, three proofs with application to number theory, areas measured by slicing and scaling where Archimedes uses the physical weights and balances to calculate spherical volume, and is led to the invention of calculus areas by cut and paste leading to the Bolyai-Gerwien theorem on squaring

polygons areas by counting leading to the theory of continued fractions the efficient rational approximation of real numbers and Minkowski's theorem on convex bodies straight edge and compass constructions giving complete proofs including the transcendence of  $e$  and of the impossibility of squaring the circle duplicating the cube and trisecting the angle and finally to a construction of the Hausdorff Banach Tarski paradox that shows some spherical sets are too complicated and cloudy to admit a well defined notion of area

An Introduction to Mathematical Finance with Applications Arlie O. Petters, Xiaoying Dong, 2016-06-17 This textbook aims to fill the gap between those that offer a theoretical treatment without many applications and those that present and apply formulas without appropriately deriving them The balance achieved will give

readers a fundamental understanding of key financial ideas and tools that form the basis for building realistic models including those that may become proprietary. Numerous carefully chosen examples and exercises reinforce the student's conceptual understanding and facility with applications. The exercises are divided into conceptual, application based, and theoretical problems which probe the material deeper. The book is aimed toward advanced undergraduates and first year graduate students who are new to finance or want a more rigorous treatment of the mathematical models used within. While no background in finance is assumed, prerequisite math courses include multivariable calculus, probability, and linear algebra. The authors introduce additional mathematical tools as needed. The entire textbook is appropriate for a single year long course on introductory mathematical finance. The self contained design of the text allows for instructor flexibility in topics, courses, and those focusing on financial derivatives. Moreover, the text is useful for mathematicians, physicists, and engineers who want to learn finance via an approach that builds their financial intuition and is explicit about model building, as well as business school students who want a treatment of finance that is deeper but not overly theoretical.

*Non-Euclidean Geometry and Curvature* James W. Cannon, 2017-11-08. This is the final volume of a three volume collection devoted to the geometry, topology, and curvature of 2 dimensional spaces. The collection provides a guided tour through a wide range of topics by one of the twentieth century's masters of geometric topology. The books are accessible to college and graduate students and provide perspective and insight to mathematicians at all levels who are interested in geometry and topology. Einstein showed how to interpret gravity as the dynamic response to the curvature of space time. Bill Thurston showed us that non Euclidean geometries and curvature are essential to the understanding of low dimensional spaces. This third and final volume aims to give the reader a firm intuitive understanding of these concepts in dimension 2. The volume first demonstrates a number of the most important properties of non Euclidean geometry by means of simple infinite graphs that approximate that geometry. This is followed by a long chapter taken from lectures the author gave at MSRI which explains a more classical view of hyperbolic non Euclidean geometry in all dimensions. Finally, the author explains a natural intrinsic obstruction to flattening a triangulated polyhedral surface into the plane without distorting the constituent triangles. That obstruction extends intrinsically to smooth surfaces by approximation and is called curvature. Gauss's original definition of curvature is extrinsic rather than intrinsic. The final two chapters show that the book's intrinsic definition is equivalent to Gauss's extrinsic definition. Gauss's Theorema Egregium, Great Theorem.

*Topology as Fluid Geometry* James W. Cannon, 2017. This is the second of a three volume collection devoted to the geometry, topology, and curvature of 2 dimensional spaces. The collection provides a guided tour through a wide range of topics by one of the twentieth century's masters of geometric topology. The books are accessible to college and graduate students and provide perspective and insight to mathematicians at all levels who are interested in geometry and topology. The second volume deals with the topology of 2 dimensional spaces. The attempts encountered in Volume 1 to understand length and area in the plane lead to examples most

easily described by the methods of topology fluid geometry finite curves of infinite length 1 dimensional curves of positive area space filling curves Peano curves 0 dimensional subsets of the plane through which no straight path can pass Cantor sets etc Volume 2 describes such sets All of the standard topological results about 2 dimensional spaces are then proved such as the Fundamental Theorem of Algebra two proofs the No Retraction Theorem the Brouwer Fixed Point Theorem the Jordan Curve Theorem the Open Mapping Theorem the Riemann Hurwitz Theorem and the Classification Theorem for Compact 2 manifolds Volume 2 also includes a number of theorems usually assumed without proof since their proofs are not readily available for example the Zippin Characterization Theorem for 2 dimensional spaces that are locally Euclidean the Schoenflies Theorem characterizing the disk the Triangulation Theorem for 2 manifolds and the R L Moore s Decomposition Theorem so useful in understanding fractal sets

**Optimization and Approximation** Pablo Pedregal,2017-09-07 This book provides a basic initial resource introducing science and engineering students to the field of optimization It covers three main areas mathematical programming calculus of variations and optimal control highlighting the ideas and concepts and offering insights into the importance of optimality conditions in each area It also systematically presents affordable approximation methods Exercises at various levels have been included to support the learning process

*Introduction to Distributed Computer Systems* Ludwik Czaja,2018-01-24 This book introduces readers to selected issues in distributed systems and primarily focuses on principles not on technical details Though the systems discussed are based on existing von Neumann computer architectures the book also touches on emerging processing paradigms Uniquely it approaches system components not only as static constructs but also in action exploring the different states they pass through The author s teaching experience shows that newcomers to the field students and even IT professionals can far more readily grasp the essence of distributed algorithmic structures in action than on the basis of static descriptions
