The respiratory system is made up of

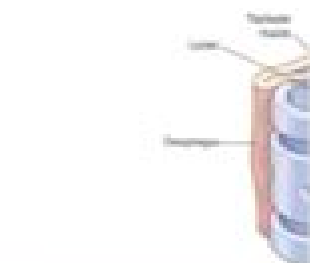

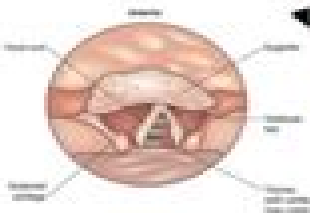

- Nose
- Pharynx (throat)
- Larynx (voice box)
- Trachea (windpipe)
- Bronchi (airways branching from the trachea)
- Alveoli (tiny air sacs where gas exchange occurs)

Right and Left Lungs

Our respiratory system has two lungs. The right lung is larger and wider, while the left lung is smaller and narrower. The right lung is divided into three lobes, while the left lung is divided into two lobes.

The mechanisms of respiration involve the contraction and relaxation of the diaphragm and the external intercostal muscles. The diaphragm contracts and moves down, while the external intercostal muscles contract and pull the rib cage up and out. This increases the volume of the thoracic cavity, which decreases the pressure inside the lungs, causing air to be drawn in.

Mechanisms of Respiration

- During normal quiet breathing, the diaphragm contracts and moves down, while the external intercostal muscles contract and pull the rib cage up and out. This increases the volume of the thoracic cavity, which decreases the pressure inside the lungs, causing air to be drawn in.
- During forced breathing, the diaphragm contracts and moves down, while the external intercostal muscles contract and pull the rib cage up and out. This increases the volume of the thoracic cavity, which decreases the pressure inside the lungs, causing air to be drawn in.

- Inhalation** - The muscles of respiration contract and pull the rib cage up and out, while the diaphragm contracts and moves down. This increases the volume of the thoracic cavity, which decreases the pressure inside the lungs, causing air to be drawn in.
- Exhalation** - The muscles of respiration relax, and the rib cage moves down and in, while the diaphragm relaxes and moves up. This decreases the volume of the thoracic cavity, which increases the pressure inside the lungs, causing air to be forced out.

- Compliance** - The ease with which the lungs can be inflated. High compliance means the lungs can be inflated easily, while low compliance means the lungs are stiff and difficult to inflate.
- Elasticity** - The ability of the lungs to return to their original shape after being inflated. High elasticity means the lungs can return to their original shape easily, while low elasticity means the lungs are stiff and difficult to deflate.

Lung Volumes

- Residual Volume** - The volume of air that remains in the lungs after a maximal expiration.
- Tidal Volume** - The volume of air that is inhaled and exhaled during normal breathing.
- Inspiratory Reserve Volume** - The volume of air that can be inhaled above the tidal volume.
- Expiratory Reserve Volume** - The volume of air that can be exhaled below the tidal volume.
- Vital Capacity** - The maximum volume of air that can be inhaled and exhaled during a maximal inspiration and expiration.

Respiratory Patterns

- Normal** - Normal, unaltered breathing.
- Apnea** - No breathing.
- Hyperventilation** - An abnormally rapid breathing rate of more than 20 breaths per minute.
- Bradypnea** - An abnormally slow rate of breathing.
